

## Creating Other Schema Objects

# What you will learn at the end of this Session?

- 1. Create simple and complex views**
- 2. Retrieve data from views**
- 3. Create, maintain, and use sequences**
- 4. Create and maintain indexes**
- 5. Create private and public synonyms**

# Database Objects

Object	Description
Table	Basic unit of storage; composed of rows
View	Logically represents subsets of data from one or more tables
Sequence	Generates numeric values
Index	Improves the performance of data retrieval queries
Synonym	Gives alternative names to objects

# What Is a View?

## EMPLOYEES table

EMPLOYEE_ID	FIRST_NAME	LAST_NAME	EMAIL	PHONE_NUMBER	HIRE_DATE	JOB_ID	SALARY
100	Steven	King	SKING	515.123.4567	17-JUN-87	AD_PRES	24000
101	Neena	Kochhar	NKOCHHAR	515.123.4568	21-SEP-89	AD_VP	17000
102	Lex	De Haan	LDEHAAN	515.123.4569	13-JAN-93	AD_VP	17000
103	Alexander	Hunold	AHUNOLD	590.423.4567	03-JAN-90	IT_PROG	9000
104	Bruce	Ernst	BERNST	590.423.4566	17-FEB-96	IT_PROG	6000
105	David	Turner	DTURNER	590.423.4565	17-SEP-98	SA_REP	4200
106	Walter	Clark	WCLARK	590.423.4564	17-SEP-98	SA_REP	6900
107	John	Smith	JSMITH	590.423.4563	17-SEP-98	SA_REP	5800
108	Paul	Herman	PHERMAN	590.423.4562	17-SEP-98	SA_REP	3500
109	Rene	Green	RGREEN	590.423.4561	17-SEP-98	SA_REP	3100
110	Anthony	Pavlow	APAVLOW	590.423.4560	17-SEP-98	SA_REP	2600
111	Alexis	Burns	ABURNS	590.423.4559	17-SEP-98	SA_REP	2500
112	Bruce	King	BKING	590.423.4558	17-SEP-98	SA_REP	10500
113	David	Adams	DADAMS	590.423.4557	17-SEP-98	SA_REP	11000
114	Neena	Kochhar	NKOCHHAR	590.423.4556	17-SEP-98	SA_REP	8600
115	Lex	De Haan	LDEHAAN	590.423.4555	17-SEP-98	SA_REP	7000
116	Alexander	Hunold	AHUNOLD	590.423.4554	17-SEP-98	SA_REP	4400
117	Bruce	Ernst	BERNST	590.423.4553	17-SEP-98	SA_REP	13000
118	David	Turner	DTURNER	590.423.4552	17-SEP-98	SA_REP	6000
119	Walter	Clark	WCLARK	590.423.4551	17-SEP-98	SA_REP	12000
120	John	Smith	JSMITH	590.423.4550	17-SEP-98	SA_REP	8300

# Advantages of Views

## Simple Views and Complex Views

Feature	Simple Views	Complex Views
Number of tables	One	One or more
Contain functions	No	Yes
Contain groups of data	No	Yes
DML operations through a view	Yes	Not always

- You embed a subquery in the CREATE VIEW statement:

```
CREATE [OR REPLACE] [FORCE|NOFORCE] VIEW view  
  [(alias[, alias]...)]  
  AS subquery  
[WITH CHECK OPTION [CONSTRAINT constraint]]  
[WITH READ ONLY [CONSTRAINT constraint]];
```

- The subquery can contain complex SELECT syntax.

- Create the EMPVU80 view, which contains details of the employees in department 80:

```
CREATE VIEW ordvu  
AS SELECT order_id , order_date , order_status  
FROM orders  
WHERE order_status = 10 ;
```

```
CREATE VIEW succeeded.
```

- Describe the structure of the view by using the SQL\*Plus

```
DESCRIBE ordvu ;
```

# Creating a View

---

- Create a view by using column aliases in the subquery:

```
CREATE VIEW ordvu  
AS SELECT order_id , order_status , order_total / 12 Total_per_Month  
FROM orders  
WHERE order_status = 10 ;
```

```
CREATE VIEW succeeded.
```

- Select the columns from this view by the given alias names.

100

```
SELECT *  
FROM ordvu ;
```

[illegible]

- Modify the EMPVU80 view by using a CREATE OR REPLACE VIEW clause. Add an alias for each column name:

```
CREATE OR REPLACE VIEW ordvu
  (order_id, order_date, order_status)
AS SELECT  order_id, to_char(order_date, 'fmDD-Mon-YYYY')
           , order_status)
FROM      orders
WHERE     order_status = 10;
```

CREATE OR REPLACE VIEW succeeded.

- Column aliases in the CREATE OR REPLACE VIEW clause are listed in the same order as the columns in the subquery.

## Creating a Complex View

Create a complex view that contains group functions to display values from two tables:

```
CREATE OR REPLACE VIEW dept_sum_vu
  (name, minsal, maxsal, avgsal)
AS SELECT    d.department_name, MIN(e.salary),
             MAX(e.salary), AVG(e.salary)
  FROM      employees e JOIN departments d
  ON        (e.department_id = d.department_id)
  GROUP BY  d.department_name;
```

```
CREATE OR REPLACE VIEW succeeded.
```

## Rules for Performing DML Operations on a View

**You can usually perform DML operations on simple views.**

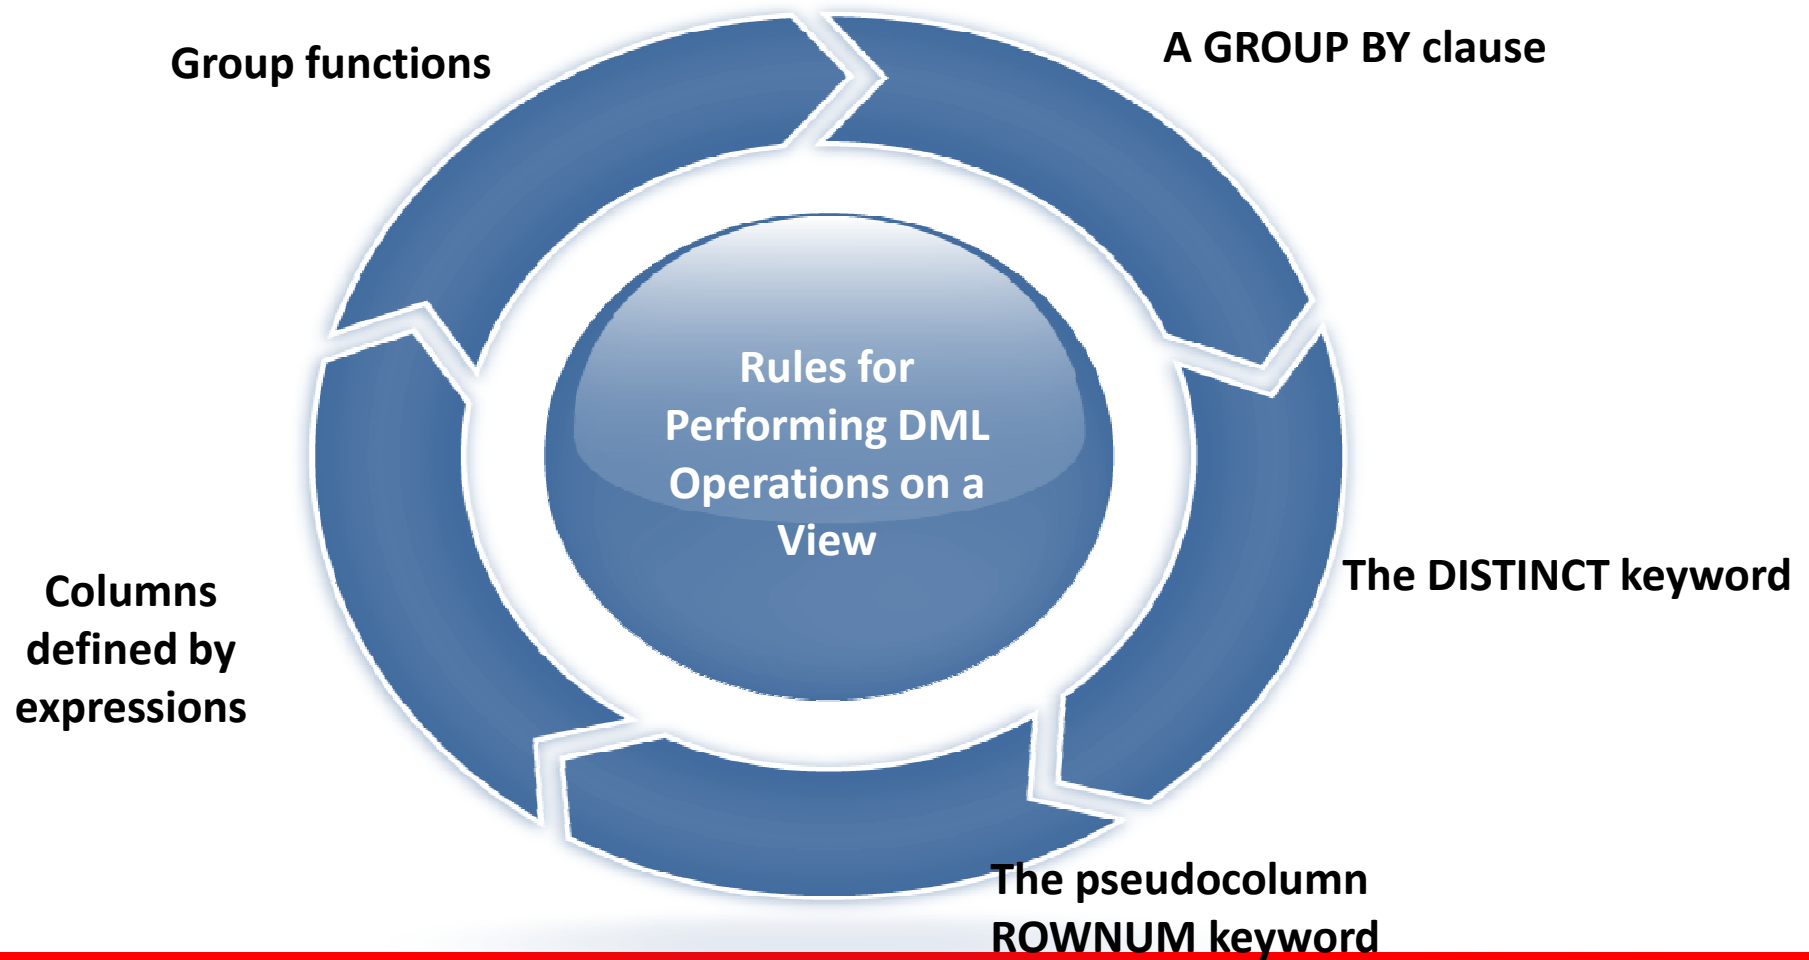

**You cannot**

**remove a row if the view contains the following:**

- **Group functions**
- **A GROUP BY clause**
- **The DISTINCT keyword**
- **The pseudo column ROWNUM keyword**

# Rules for Performing DML Operations on a View

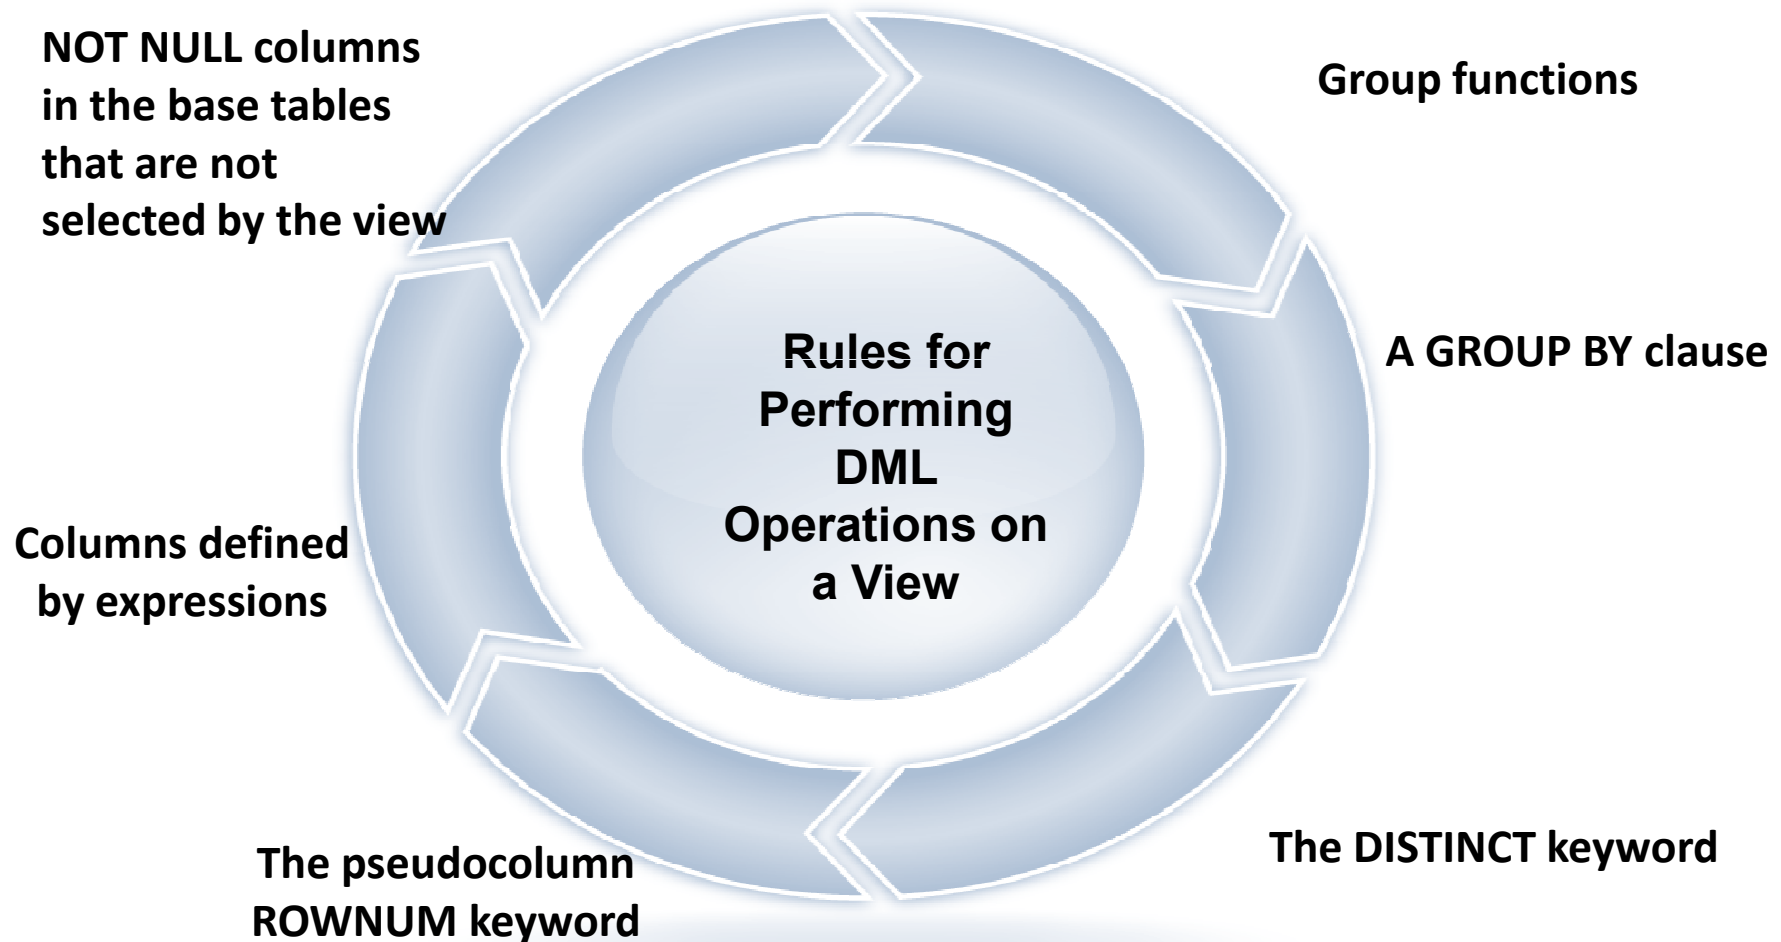

- You cannot modify data in a view if it contains:

ORACLE

# Rules for Performing DML Operations on a View

•You cannot add data through a view if the view includes:

## Using the WITH CHECK OPTION Clause

- You can ensure that DML operations performed on the view stay in the domain of the view by using the WITH CHECK OPTION clause:

```
CREATE OR REPLACE VIEW ordvu
AS SELECT      *
   FROM      orders
   WHERE     order_status = 10
   WITH CHECK OPTION CONSTRAINT ordvu20_ck ;
```

```
CREATE OR REPLACE VIEW succeeded.
```

- Any attempt to INSERT a row with an order\_status other than 10, or to UPDATE the status number for any row in the view fails because it violates the WITH CHECK OPTION constraint.

## Denying DML Operations

---

- You can ensure that no DML operations occur by adding the **WITH READ ONLY** option to your view definition.
- Any attempt to perform a DML operation on any row in the view results in an Oracle server error.

## Denying DML Operations

```
CREATE VIEW ordvu  
AS SELECT order_id , order_status , order_total / 12 Total_per_Month  
FROM orders  
WHERE order_status = 10 ;  
WITH READ ONLY ;
```

```
CREATE OR REPLACE VIEW succeeded.
```

## Removing a View

---

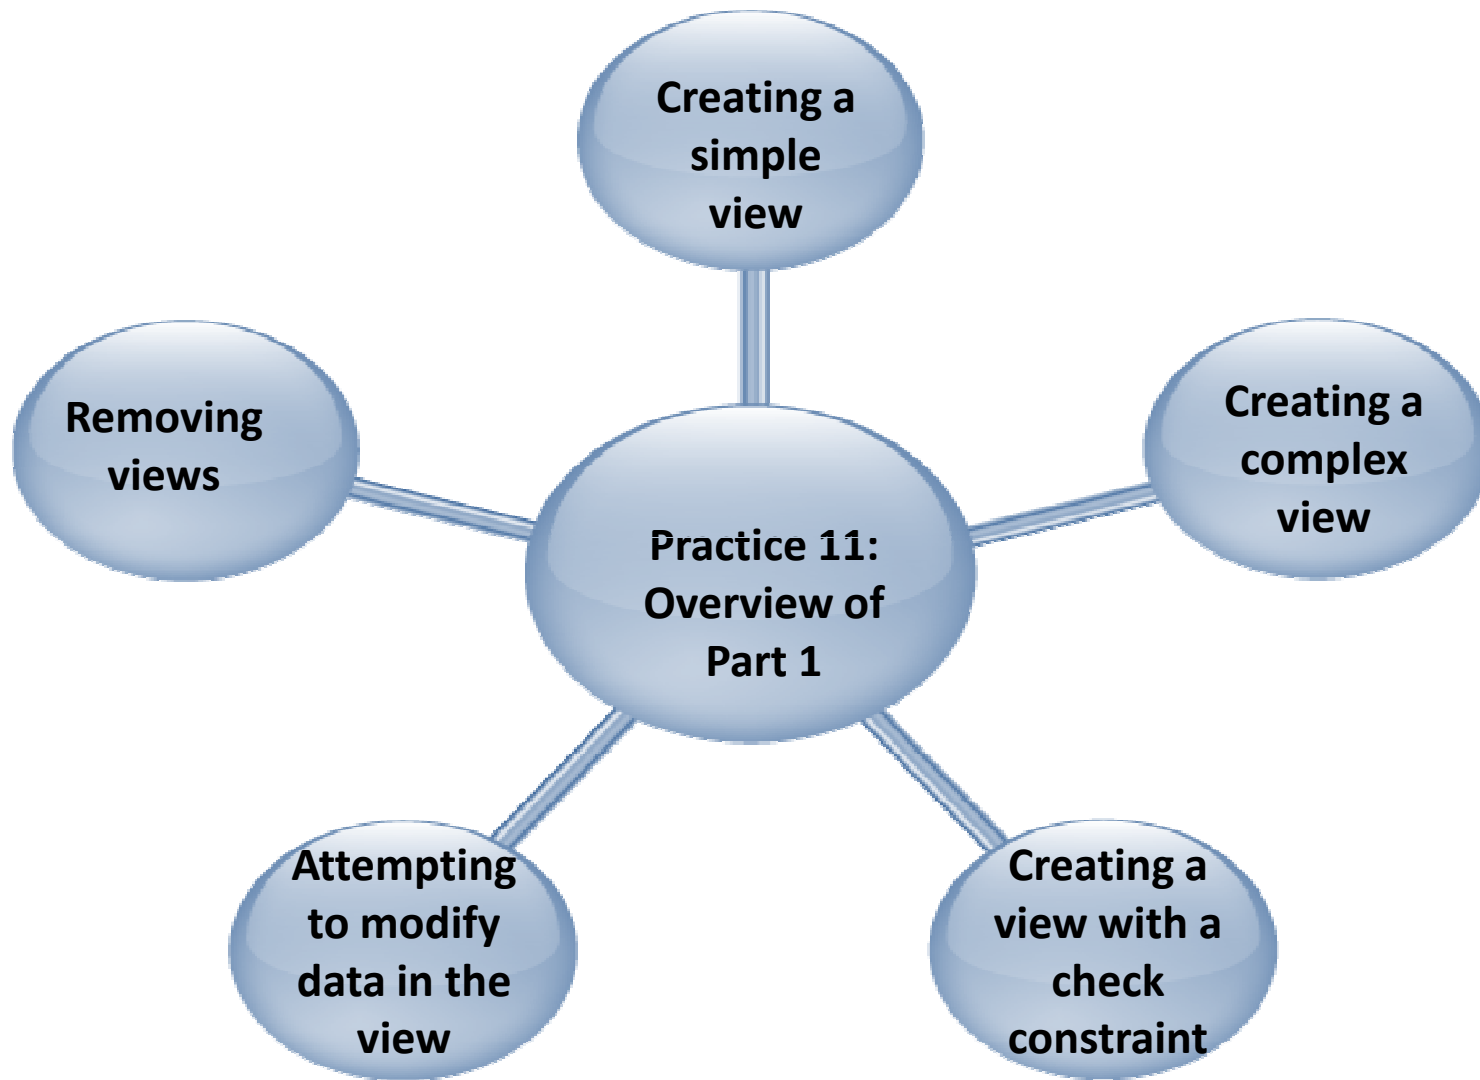

You can remove a view without losing data because a view is based on underlying tables in the database.

```
DROP VIEW view;
```

```
DROP VIEW ordvu;
```

```
DROP VIEW empvu80 succeeded.
```

## Practice 11: Overview of Part 1

Object	Description
Table	Basic unit of storage; composed of rows
View	Logically represents subsets of data from one or more tables
Sequence	Generates numeric values
Index	Improves the performance of some queries
Synonym	Gives alternative names to objects

## A sequence:

- Can automatically generate unique numbers
- Is a shareable object
- Can be used to create a primary key value
- Replaces application code
- Speeds up the efficiency of accessing sequence values when cached in memory

## CREATE SEQUENCE Statement: Syntax

---

Define a sequence to generate sequential numbers automatically:

```
CREATE SEQUENCE sequence
    [INCREMENT BY n]
    [START WITH n]
    [{MAXVALUE n | NOMAXVALUE}]
    [{MINVALUE n | NOMINVALUE}]
    [{CYCLE | NOCYCLE}]
    [{CACHE n | NOCACHE}];
```

## Creating a Sequence

---

- Create a sequence named DEPT\_DEPTID\_SEQ to be used for the primary key of the DEPARTMENTS table.
- Do not use the CYCLE option.

```
CREATE SEQUENCE ord_ordid_seq  
            INCREMENT BY 10  
            START WITH 120  
            MAXVALUE 9999  
            NOCACHE  
            NOCYCLE ;
```

CREATE SEQUENCE succeeded.

## NEXTVAL and CURRVAL Pseudocolumns

---

- **NEXTVAL** returns the next available sequence value. It returns a unique value every time it is referenced, even for different users.
- **CURRVAL** obtains the current sequence value.
- **NEXTVAL** must be issued for that sequence before **CURRVAL** contains a value.

- Insert a new order with mode “Direct” and status 5:

```
INSERT INTO orders ( order_id ,  
                    order_date , order_mode , order_status )  
VALUES ( ord_ordid_seq.NEXTVAL,  
        to_char (SYSDATE , 'fmDD-Mon-YYYY' ) ,  
        'direct', 1 ) ;
```

```
1 rows inserted
```

- View the current value for the DEPT\_DEPTID\_SEQ sequence:

```
SELECT  ord_ordid_seq.CURRVAL  
FROM    dual ;
```

# Caching Sequence Values

---

**Caching sequence values in memory gives faster access to those values.**

**Gaps in sequence values can occur when:**

- **A rollback occurs**
- **The system crashes**
- **A sequence is used in another table**

## Modifying a Sequence

---

Change the increment value, maximum value, minimum value, cycle option, or cache option:

```
ALTER SEQUENCE ord_ordid_seq  
    INCREMENT BY 20  
    MAXVALUE 999999  
    NOCACHE  
    NOCYCLE ;
```

```
ALTER SEQUENCE dept_deptid_seq succeeded.
```

# Guidelines for Modifying a Sequence

## ALTER Privelege

You must be the owner or have the ALTER privilege for the sequence.

## Future sequence

Only future sequence numbers are affected.

## Re-create to restart the sequence

The sequence must be dropped and re-created to restart the sequence at a different number.

## Validation

Some validation is performed.

## DROP statement

To remove a sequence, use the DROP statement

```
DROP SEQUENCE ord_ordid_seq ;
```

```
DROP SEQUENCE dept_deptid_seq succeeded.
```

Object	Description
Table	Basic unit of storage; composed of rows
View	Logically represents subsets of data from one or more tables
Sequence	Generates numeric values
Index	Improves the performance of some queries
Synonym	Gives alternative names to objects

## **An index:**

- **Is a schema object**
- **Can be used by the Oracle server to speed up the retrieval of rows by using a pointer**
- **Can reduce disk input/output (I/O) by using a rapid path access method to locate data quickly**
- **Is independent of the table that it indexes**
- **Is used and maintained automatically by the Oracle server**

# How Are Indexes Created?

- **Automatically:** A unique index is created automatically when you define a **PRIMARY KEY** or **UNIQUE** constraint in a table definition.

- **Manually:** Users can create nonunique indexes on columns to speed up access to the rows.

- Create an index on one or more columns:

```
CREATE [UNIQUE][BITMAP]INDEX index  
ON table (column[, column]...);
```

- Improve the speed of query access to the ORDER\_ID column in the ORDERS table:

```
CREATE INDEX ord_ordid_idx  
ON          orders (order_id) ;
```

```
CREATE INDEX succeeded.
```

# Index Creation Guidelines

Create an index when:	
✓	A column contains a wide range of values
✓	A column contains a large number of null values
✓	One or more columns are frequently used together in a <code>WHERE</code> clause or a join condition
✓	The table is large and most queries are expected to retrieve less than 2% to 4% of the rows in the table
Do not create an index when:	
✗	The columns are not often used as a condition in the query
✗	The table is small or most queries are expected to retrieve more than 2% to 4% of the rows in the table
✗	The table is updated frequently
✗	The indexed columns are referenced as part of an expression

- Remove an index from the data dictionary by using the DROP INDEX command:

```
DROP INDEX index;
```

- Remove the emp\_last\_name\_idx index from the data dictionary:

```
DROP INDEX ord_ordid_idx ;  
DROP INDEX emp_last_name_idx succeeded.
```

- To drop an index, you must be the owner of the index or have the DROP ANY INDEX privilege.

Object	Description
Table	Basic unit of storage; composed of rows
View	Logically represents subsets of data from one or more tables
Sequence	Generates numeric values
Index	Improves the performance of some queries
Synonym	Gives alternative names to objects

# Creating a Synonym for an Object

---

Simplify access to objects by creating a synonym (another name for an object). With synonyms, you can:

Create an easier reference to a table that is owned by another user

Shorten lengthy object names

```
CREATE [PUBLIC] SYNONYM synonym  
FOR      object;
```

## Creating and Removing Synonyms

---

- Create a shortened name for the DEPT\_SUM\_VU view:

```
CREATE SYNONYM o_sum  
FOR ord_sum_vu ;
```

```
CREATE SYNONYM succeeded.
```

- Drop a synonym:

```
DROP SYNONYM o_sum;
```

```
DROP SYNONYM d_sum succeeded.
```

**Indexes must be created manually and serve to speed up access to rows in a table.**

**1.True**

**2.False**

**1. Create, use, and remove views**

**2. Automatically generate sequence numbers by using a sequence generator**

**3. Create indexes to improve speed of query retrieval**

**4. Use synonyms to provide alternative names for objects**

## Practice 11: Overview of Part 2
