Lesson 3

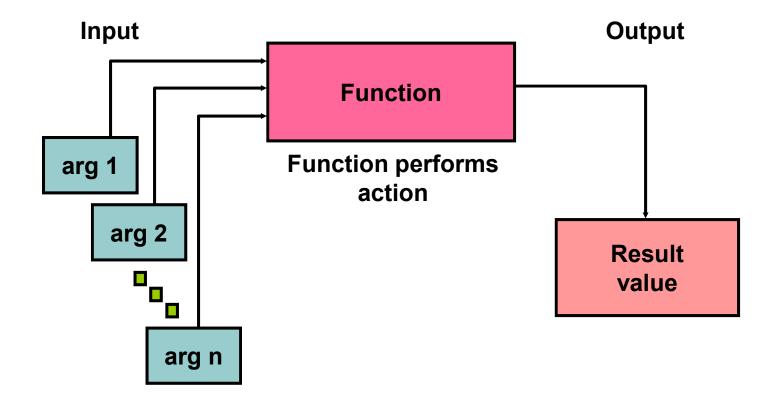

Using Single-Row Functions to Customize Output

What You will learn at the end of this Session?

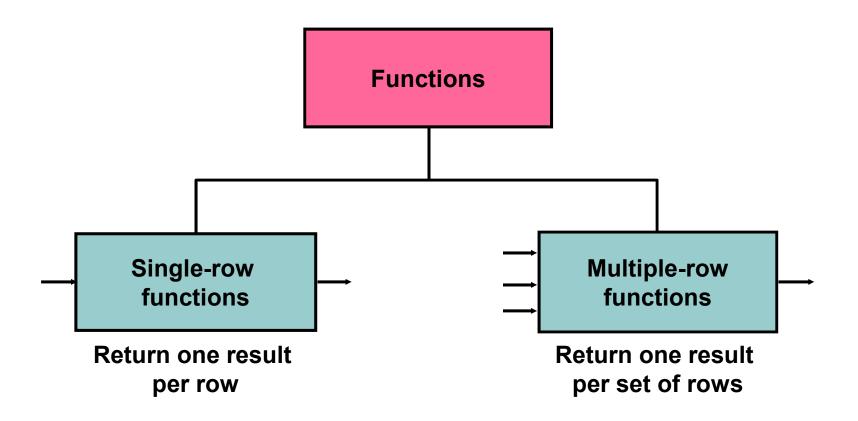

1. Describe the various types of functions available in SQL

2. Use the character, number, and date functions in SELECT statements

Two Types of SQL Functions

Single-Row Functions

Manipulate data items

Accept arguments and return one value

Act on each row that is returned

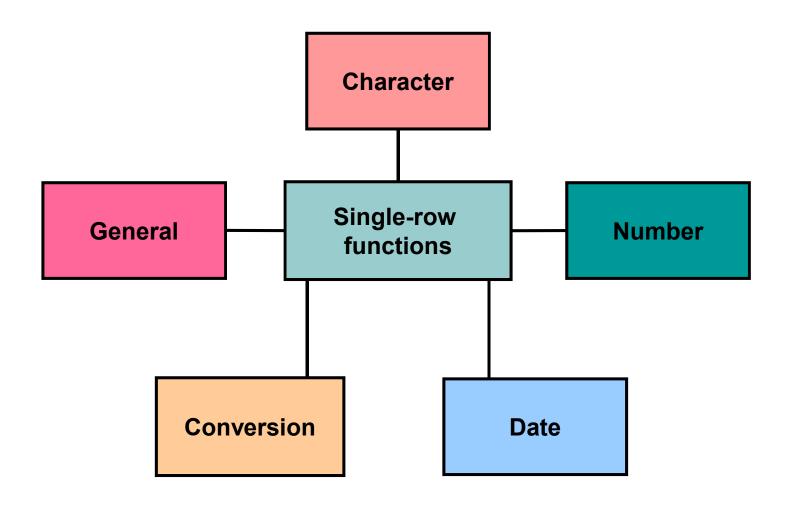

Return one result per row

May modify the data type

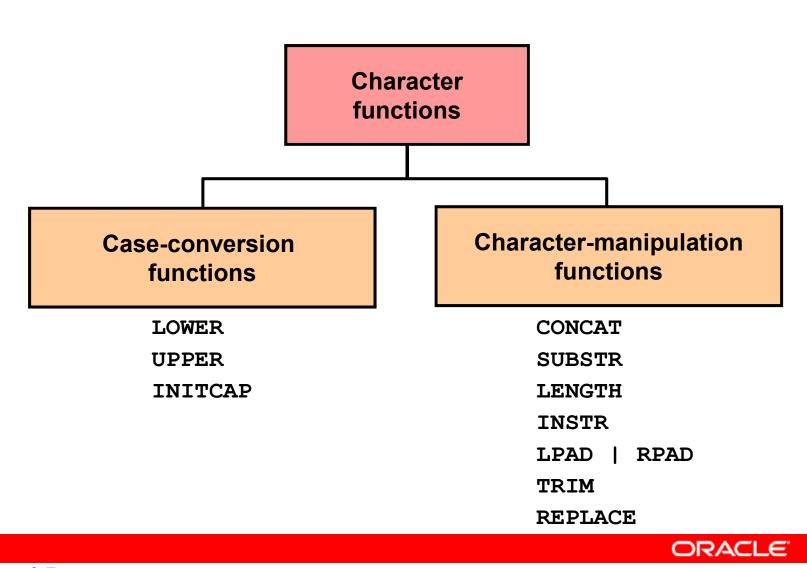

Can be nested

Accept arguments that can be a column or an expression

Single-Row Functions

Character Functions

Case-Conversion Functions

•These functions convert the case for character strings:

Function	Result
LOWER(SQL Course)	sql course
UPPER(SQL Course)	SQL COURSE
INITCAP(SQL Course)	Sql Course

Using Case-Conversion Functions

•Display the first name, last name, and email for customer Donald:

```
SELECT first_name, last_name, email
FROM customers
WHERE first_name = 'donald';

0 rows selected
```

```
SELECT first_name, last_name, email FROM customers
WHERE lower(first_name) = 'donald';
```

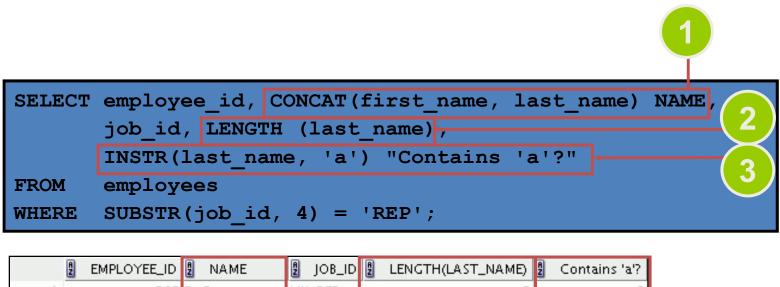

Character-Manipulation Functions

•These functions manipulate character strings:

Function	Result
CONCAT('Hello', 'World')	HelloWorld
SUBSTR('HelloWorld',1,5)	Hello
LENGTH('HelloWorld')	10
<pre>INSTR('HelloWorld', 'W')</pre>	6
LPAD(salary,10, '*')	****24000
RPAD(salary, 10, '*')	24000****
REPLACE ('JACK and JUE','J','BL')	BLACK and BLUE
TRIM('H' FROM 'HelloWorld')	elloWorld

Using the Character-Manipulation Functions

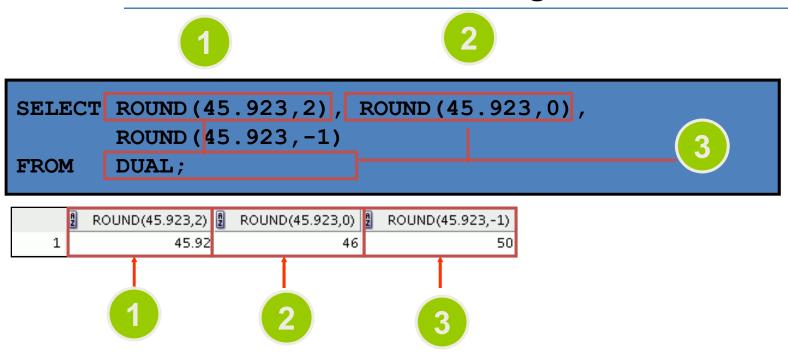

ROUND: Rounds value to a specified decimal

TRUNC: Truncates value to a specified decimal

– MOD: Returns remainder of division

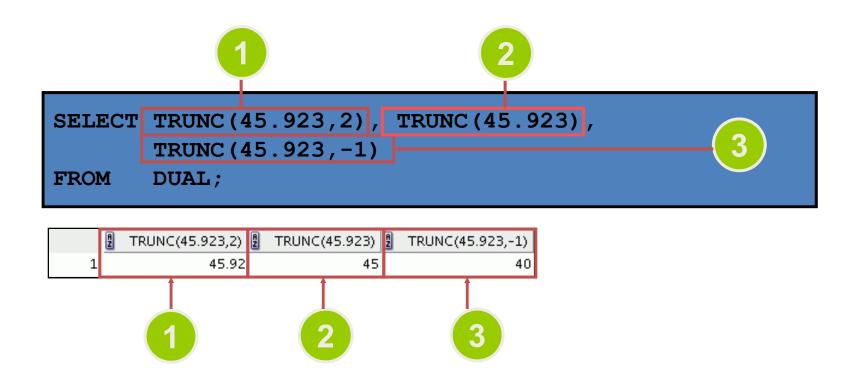

Function	Result
ROUND(45.926, 2)	45.93
TRUNC (45.926, 2)	45.92
MOD(1600, 300)	100

Using the ROUND Function

DUAL is a public table that you can use to view results from functions and calculations.

Using the TRUNC Function

Using the MOD Function

•For all employees with the job title of Sales Representative, calculate the remainder of the salary after it is divided by 5,000.

```
SELECT order_id, order_total, MOD(order_total, 5000)
FROM orders
WHERE order_id IN(2458, 2397, 2454);
```

	A	ORDER_ID	A	ORDER_TOTAL	Ð	MOD(ORDER_TOTAL,5000)
1		2397		42283.2		2283.2
2		2454		6653.4		1653.4
3		2458		70647.34		647.34

Working with Dates

 The Oracle Database stores dates in an internal numeric format: century, year, month, day, hours, minutes, and seconds.

- The default date display format is DD-MON-RR.
 - Enables you to store 21st-century dates in the 20th century by specifying only the last two digits of the year
 - Enables you to store 20th-century dates in the
 21st century in the same way

```
SELECT order_id, round(order_date), order_status
FROM orders
WHERE order_date <= '21-MAR-96';
```

Current Year	Specified Date	RR Format	YY Format
1995	27-OCT-95	1995	1995
1995	27-OCT-17	2017	1917
2001	27-OCT-17	2017	2017
2001	27-OCT-95	1995	2095

		If the specified two-digit year is:		
		0–49	50-99	
If two digits of the current year are:	0-49	The return date is in the current century	The return date is in the century before the current one	
	50 99	The return date is in the century after the current one	The return date is in the current century	

Using the SYSDATE Function

•SYSDATE is a function that returns:

- Date
- Time

SELECT sysdate
FROM dual;

Arithmetic with Dates

Add or subtract a number to or from a date for a resultant date value.

Subtract two dates to find the number of days between those dates.

Add hours to a date by dividing the number of hours by 24.

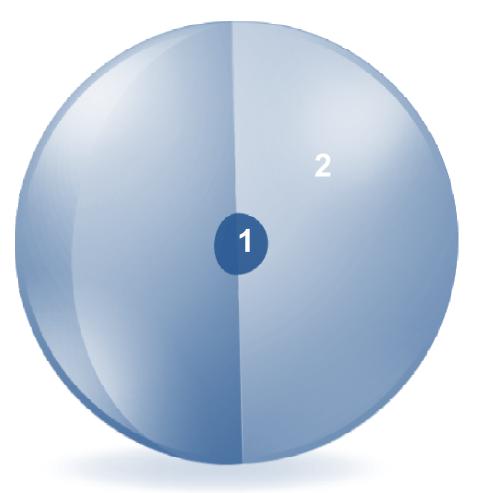

Using Arithmetic Operators with Dates

```
SELECT order_id, (SYSDATE - round(Order_date)) / 7 AS "WEEKS" FROM orders WHERE order_id IN(2458, 2397, 2454);
```

	A	ORDER_ID	2 WEEKS
1		2397	599.501043320105820105820105820105820106
2		2454	606.358186177248677248677248677248677249
3		2458	613.072471891534391534391534391534391534

- •Which of the following statements are true about single-row functions?
 - 1. Manipulate data items
 - 2. Accept arguments and return one value per argument
 - 3.Act on each row that is returned
 - 4. Return one result per set of rows
 - 5. May not modify the data type
 - 6.Can be nested
 - 7. Accept arguments that can be a column or an expression

Session Summary

1. Perform calculations on data using functions

2. Modify individual data items using functions

Practice 3: Overview

This practice covers the following topics
